1 (a) CPI measures a sort of basket of consumer goods. It differs from GDP-deflator by not bringing in the larger industrial things we produce, like steel in Sweden. The CPI are things relevant for us as individuals, food, transportation cost and so on.

1 (b) GDP can show how much the value of what our economy is producing but without dividing it by the amount of citizens it's impossible to determine a persons well being. Let's say a countrys $GDP = 1000000 \$$. If there are 1000000 persons their per capita $> 1 \$$ each. But if there are 100 persons in the country they "have" 10000 \$ each.

1,5 (c) GDP measures output and income at the same time. Because what we produce is also what we "sell". The goods/services price resulting in output which we also pay to resulting in income somewhere. It does it by looking at the two sides of the same coin so to speak.

Kapital and Labor are the
Factors that determine the output

1

(y) Diminishing returns. 10 computers won't
necessarily produce more than 1 with 1 worker.

(c)

$$Y = C + I + G$$

$$Y = C + (Y - T) + I(r) + G$$

$$S = (T - G) + (Y - T - S)$$

$$G \uparrow = IS \uparrow$$

(1)

$$\Delta Y = \Delta G \cdot \frac{1}{1 - MPC}$$

When government purchases (G) increase, it
moves the IS curve by equation (1). This
results in a move of the IS curve upward
and a new higher r and y is met.

(d)

When $r \uparrow$ the want for investments are
lower since it cost more to invest than
before the change in G.

(d)

He claims that inflation doesn't change our
purchasing power; that real interest rates are unchanged
but that the nominal is changed. Thus saying that
its only resulted in the money being printed and
that there is no real point.

2 (b) The fact that the supply is higher there will be less buyers. This resulting in a loss and making the producer change their prices to adjust to the

market. If we look at a global perspective the demand is reduced since there are some different producers.
